

BATTERY STORAGE

ACCELERATING THE ENERGY TRANSITION

MICHAEL TAYLOR

MTAYLOR@IRENA.ORG
15 MARCH 2017

The Energy Sector is Being Transformed

A *virtuous cycle* is unlocking the **economic**, **social** and **environmental** benefits of renewables

Latest RE capacity deployment

Latest RE capacity deployment

Storage

The importance of battery storage and roles

- Battery storage important part of transition now(e.g. SHS, islands, frequency response and EVs)
- Long term (integrating v high share of VRE)
- In the next 3-5 years, the storage industry is positioned to scale and echo the stark growth seen in the solar PV industry.
- Incremental improvements in energy storage technologies, developments in regional regulatory and market drivers, and emerging business models are poised to make energy storage a growing and viable part of the electricity grid
- In the stationary sector, increased economic applications due to cost declines are expected for grid services as well as increased RE penetration on islands/mini-grids and off-grid

SOLAR PV IN AFRICA: COSTS AND MARKETS

**NEW OPPORTUNITIES
UNLOCKED**

Electrification stages using solar PV

Solar PV costs in Africa

Source: IRENA Renewable Cost Database, 2016

Operating and proposed utility scale solar PV project installed costs in Africa, 2010-2018 (IRENA)

Solar PV costs in Africa

Note: All system sizes have been rounded.

Solar PV costs in Africa

Operating and proposed utility scale solar PV project installed costs in Africa, 2010-2018 (IRENA)

Generation technologies

- Solar PV
- (bio-)Diesel backup

Storage technologies

- OPzS Lead-acid batt.

Turtle Island Resort, Fiji

- **Hotel size:** 14 cottages
- **RET:** Off-grid solar PV system with 240 kW of capacity and battery storage
- **Capital cost:**
US\$ 1.5 million
- **Payback time:** 6 years
- **Savings from avoided diesel cost:**
US\$ 250,000/year

REmap
A Renewable Energy Roadmap

IRENA
International Renewable Energy Agency

#REmap

ROADMAP FOR A RENEWABLE ENERGY FUTURE

The energy transition

- **Doubling the share of renewable energy by 2030 is critical for the achievement of sustainable energy and climate change objectives**
- **Doubling renewables in the world's energy mix by 2030 will lead to savings exceeding costs up to 15 times**
- **The transition to renewables, with greater energy efficiency, can limit the global temperature increase to 2 degrees or below**

Keeping on track

Doubling renewables is critical for meeting climate objectives

Limit average global temperature rise to **2 °C** or below (when coupled with energy efficiency)

Avoid up to **12 gigatonnes** of energy-related CO₂ emissions in 2030

24.4 million jobs in the RE sector by 2030, compared to 9.2 million in 2014

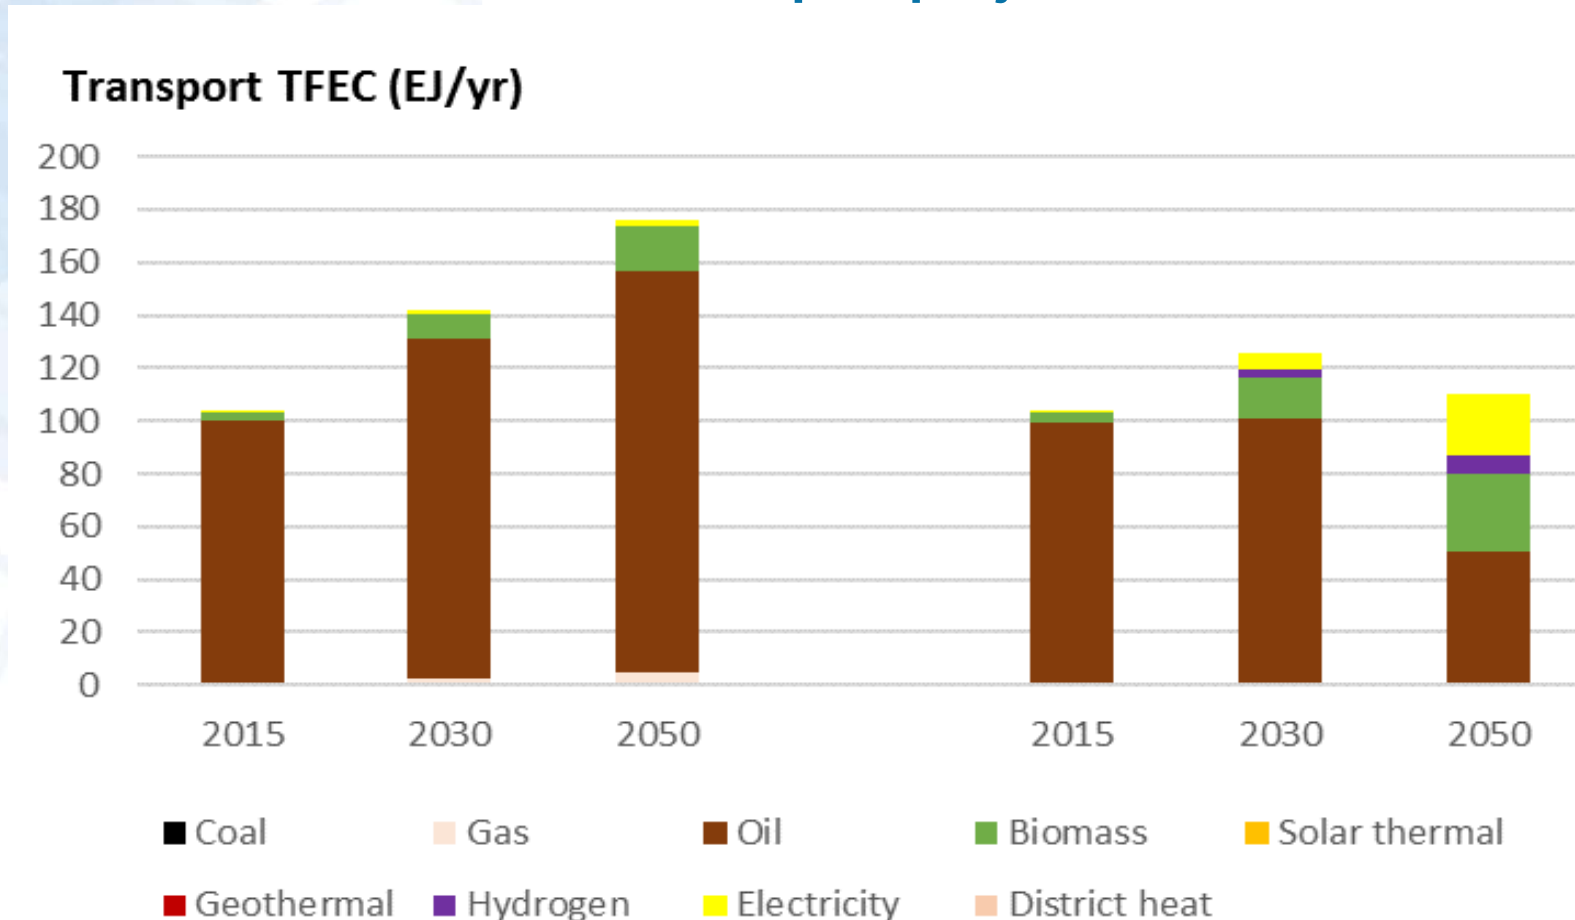

Reduce air pollution enough to save up to **4 million lives** per year

Boost global GDP by up to **\$ 1.3 trillion**

Transport, electrification and storage

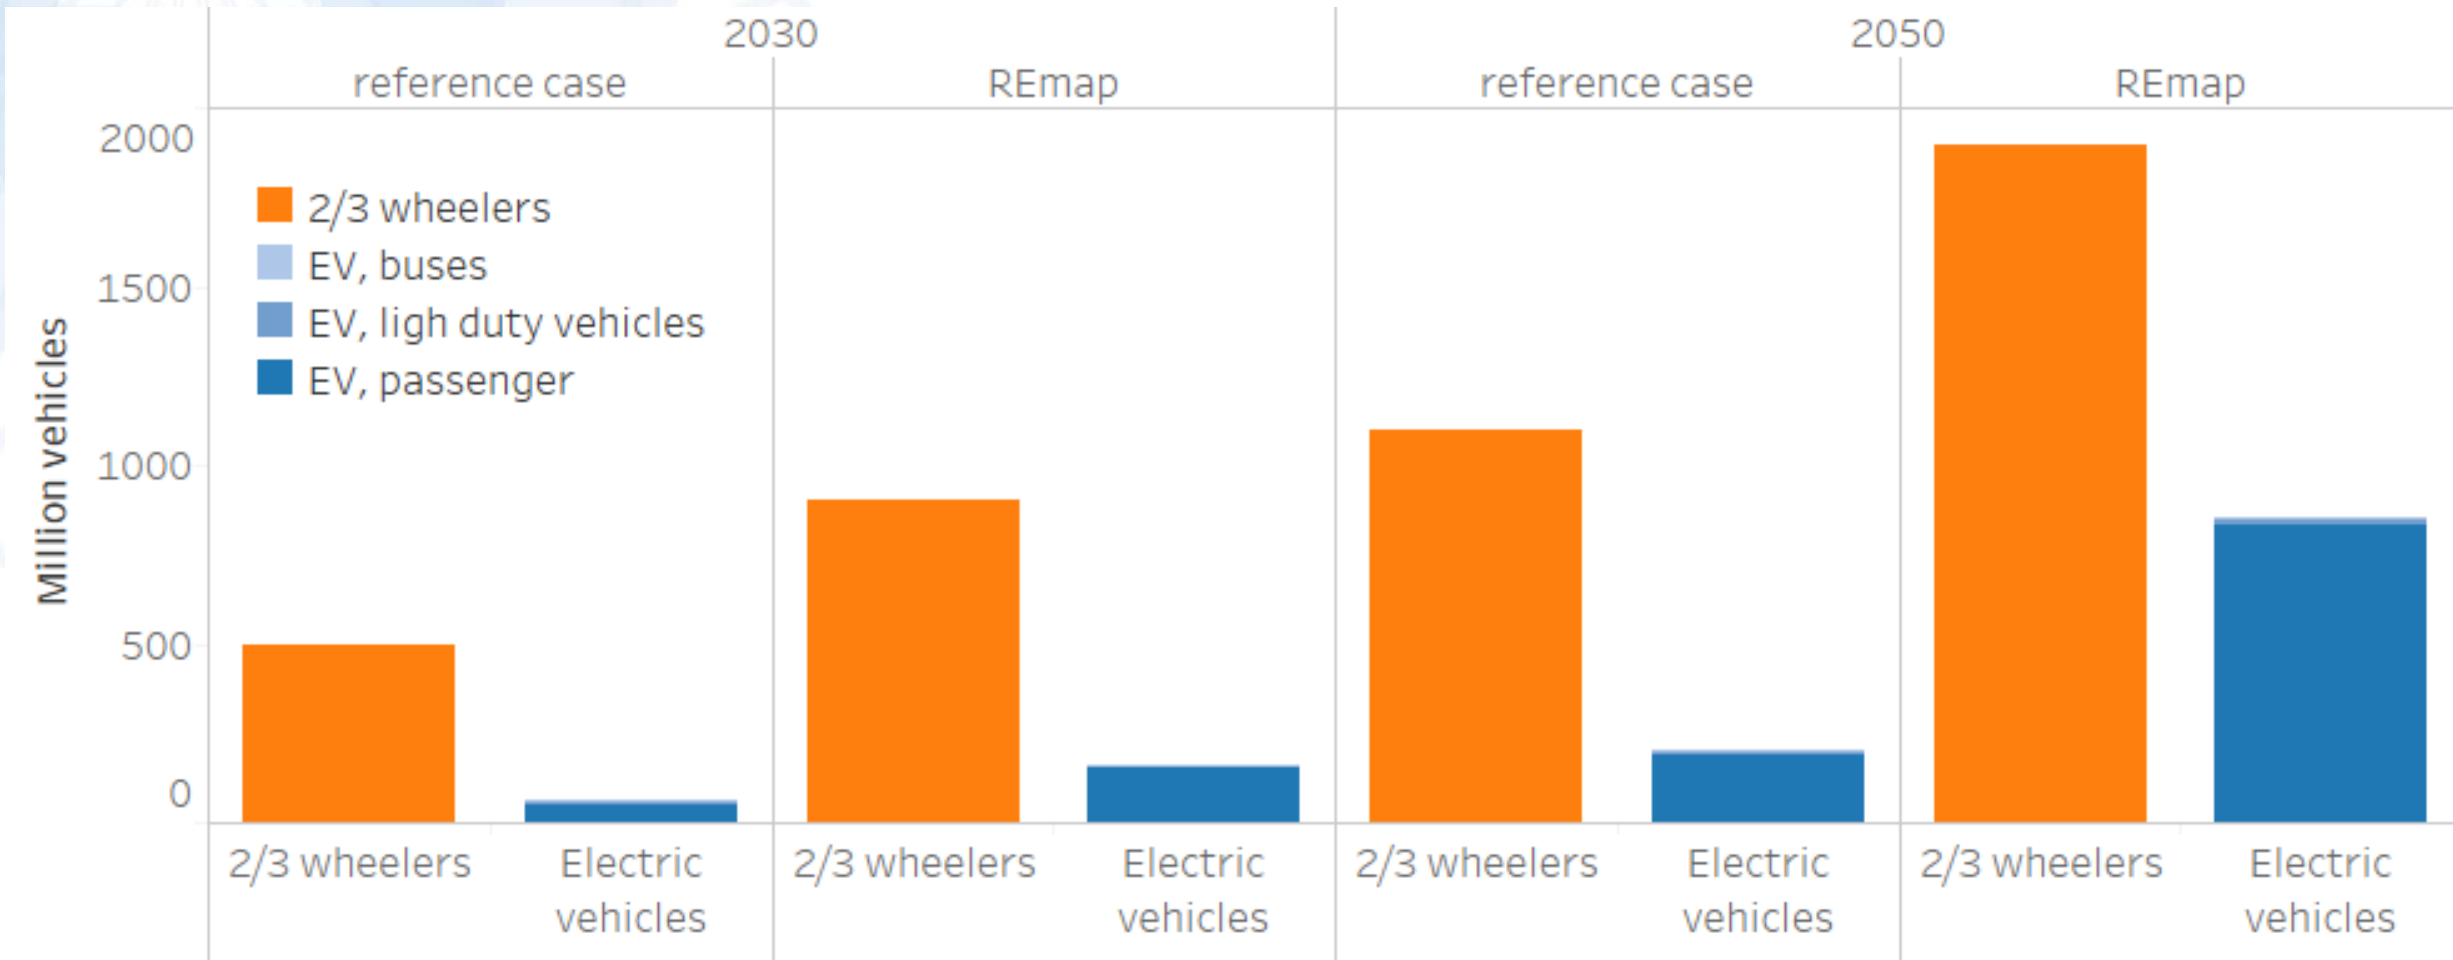

REMAP transport projections

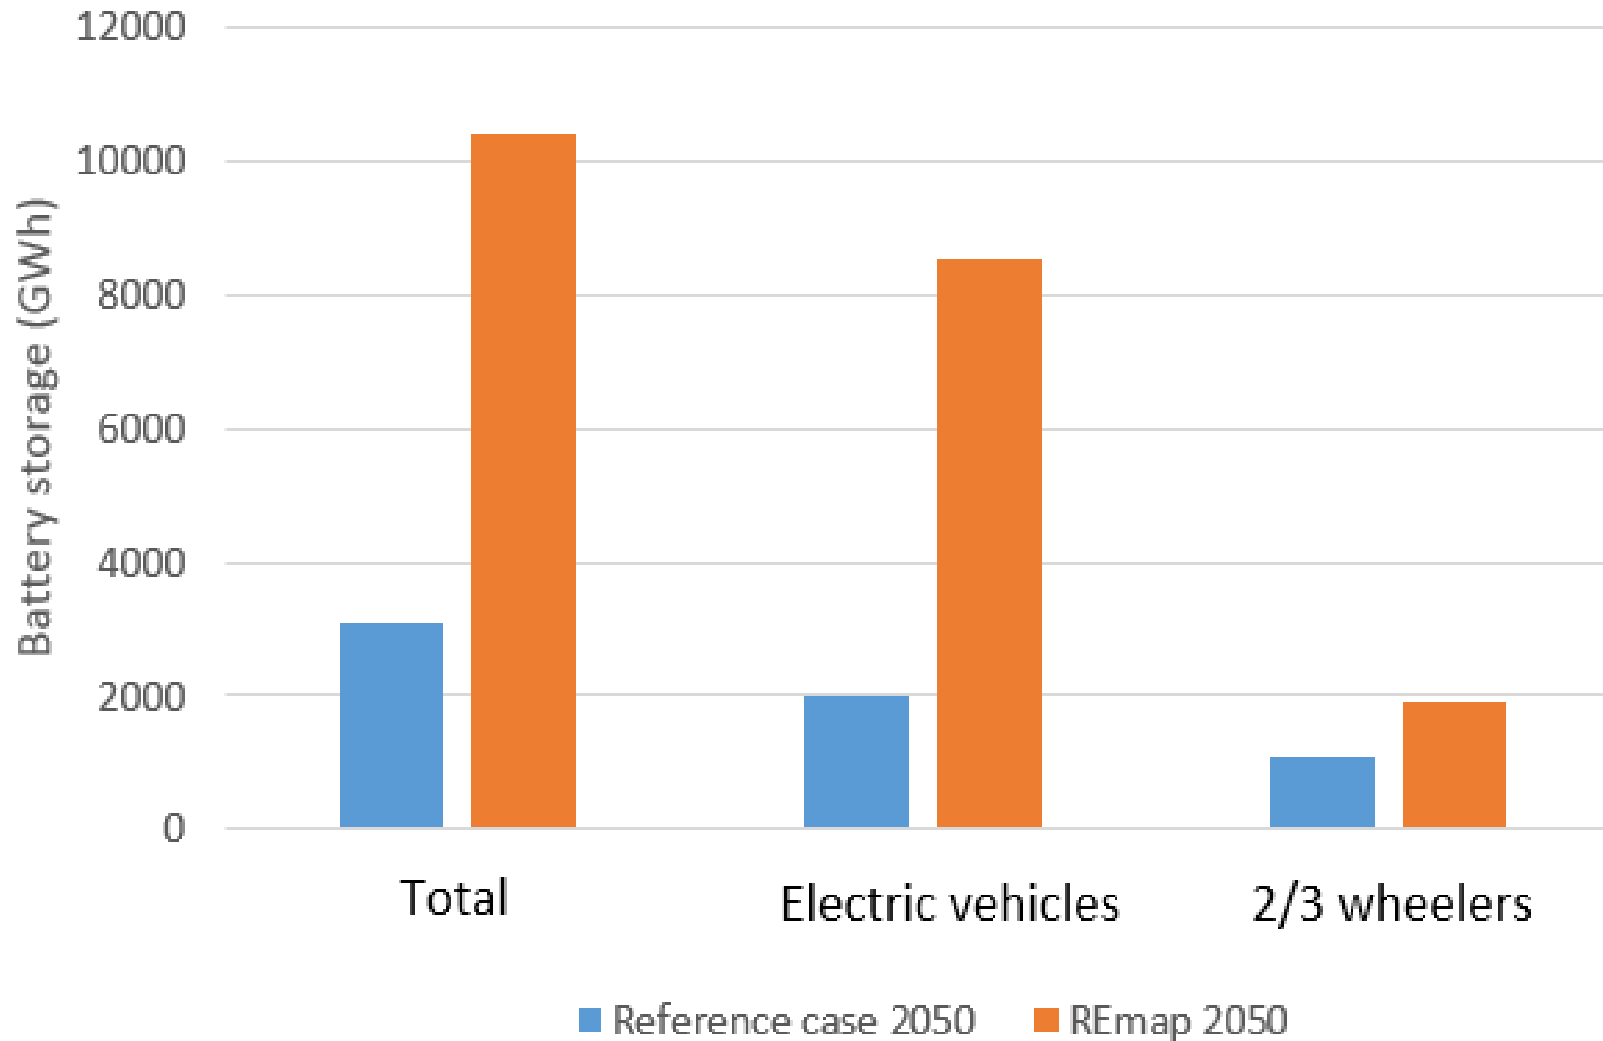

REmap sees a significant increase in electrification which covers more than 20% of the sector's total energy demand whilst bringing important efficiency gains. Biofuels will cover nearly a quarter of all demand

REMAP: The EV fleet evolution

Battery costs declines & performance improvements will play a key role in the growth rates of the EV fleet globally

REMAP: EV storage needs

Total battery storage capacity could reach more than 10 TWh in by 2050

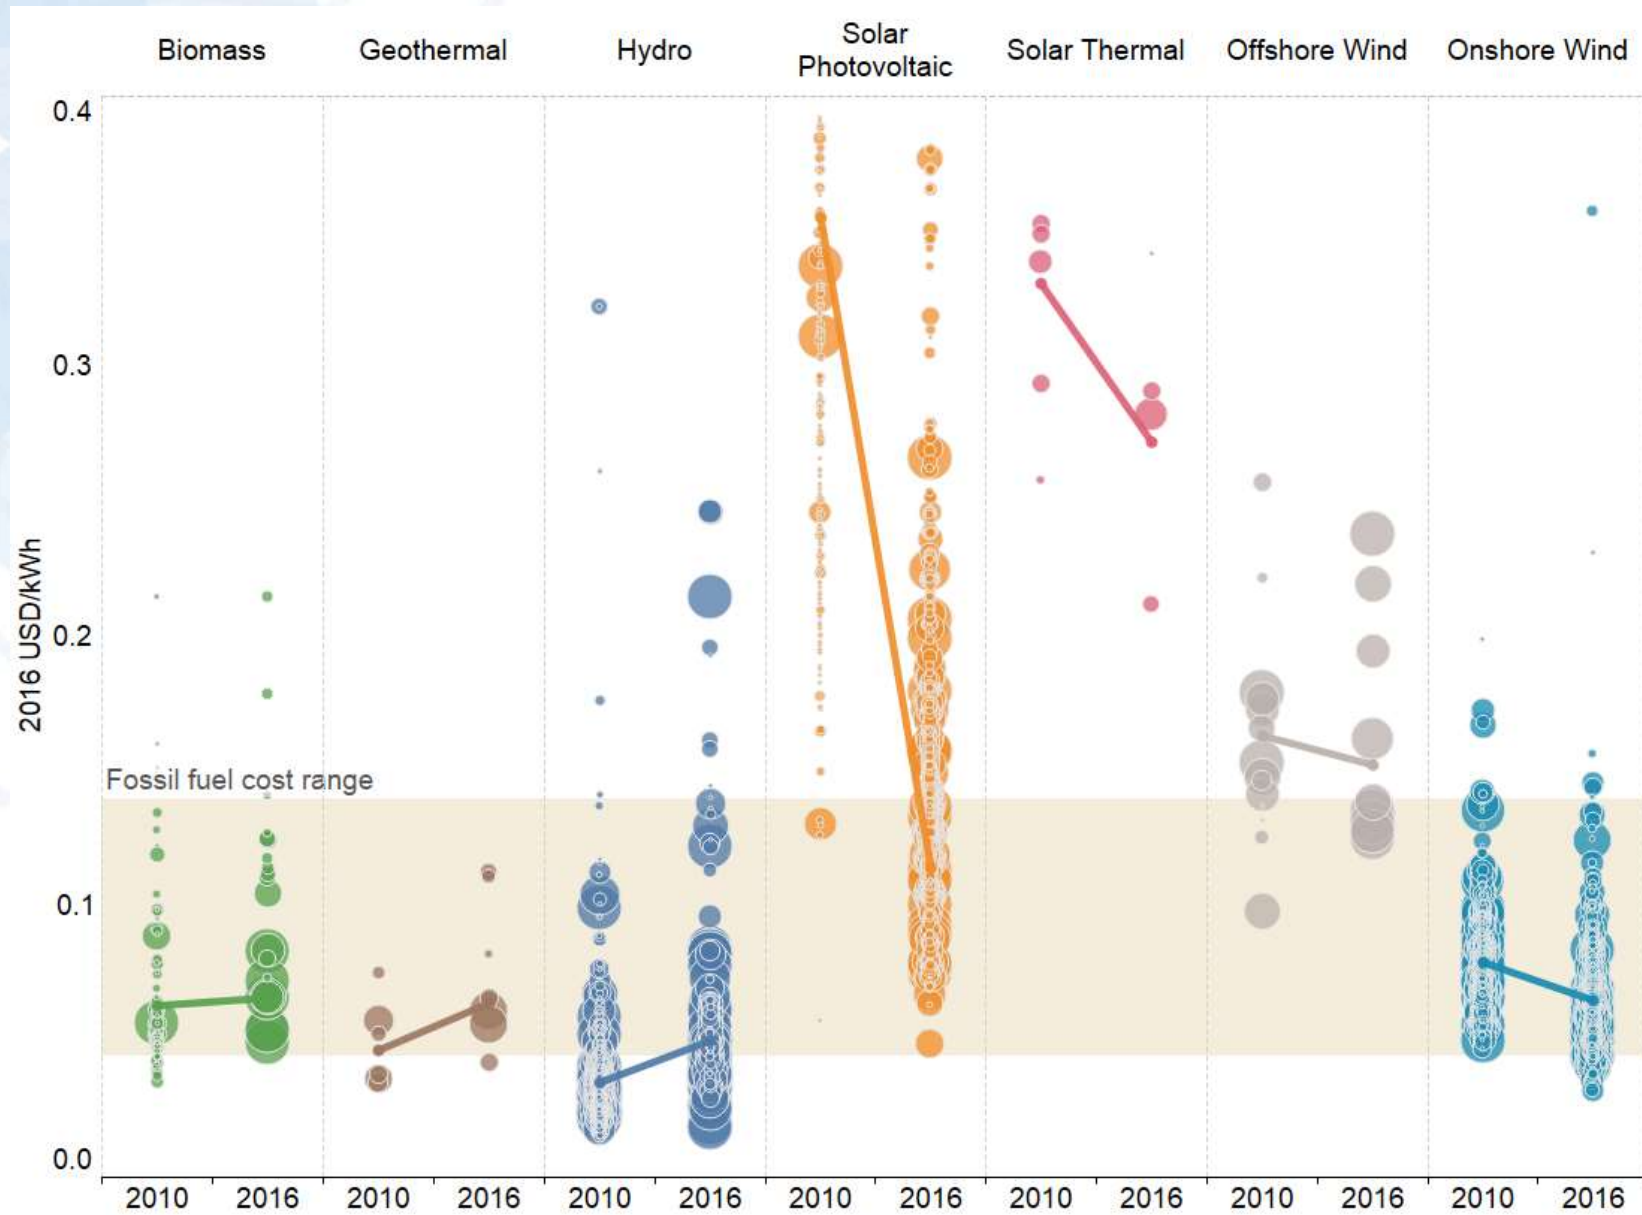

Four-fifths of capacity in EVs

The power sector will lead the way

In the Reference Case, 15 of 40 countries will have a VRE share larger than 10% by 2030. With the REmap Options, 20 countries will have a share larger than 25%.

The power sector will lead the way

Power generation capacity
(GW installed by 2030)

REmap Doubling
