# Major products from cassava in Nigeria

---

**Garri**

**Fufu**

**Cassava Flour**

**Cassava starch**

---

---

**Garri**  
**Fufu**

**Family/cottage processors**  
Wastes are scattered and  
used for animal feed

**Cassava flour**  
**Cassava starch**

Many cassava flour and cassava  
starch companies. Many with  
capacity of more than 5 t/day  
and generate average of 495kg  
wastes per tonne

**These wastes can be economically  
converted to bio-ethanol**

# Cassava Processing Wastes

## Cassava flour

<b>Peels</b>	<b>250-300 kg/t</b>
<b>Dust</b>	<b>30 kg/t</b>
<b>Fibers</b>	<b>20~40 kg</b>

## Cassava starch

<b>Peels</b>	<b>250~300 kg/t</b>
<b>Pulp</b>	<b>400 kg/t</b>

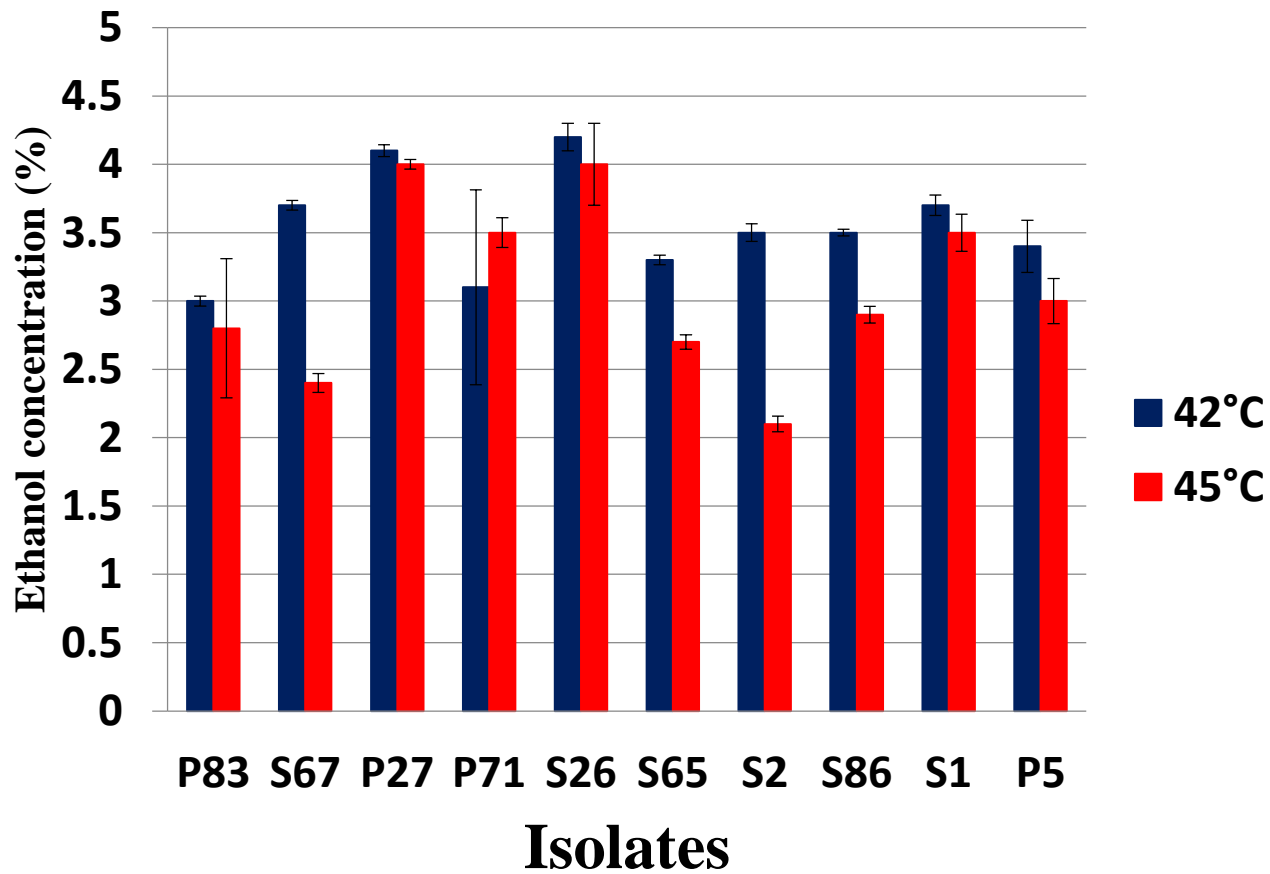

**Partially decayed and infested parts are also good substrate for bio-ethanol production**

**In order to develop a process for efficient conversion of the cassava processing wastes to ethanol, we:**

- 1. Screened for thermo-tolerant strains of yeast**
- 2. Optimized their ethanol production from cassava processed wastes in flask cultures**
- 3. Produced ethanol from the wastes using a 5-L jar fermentor**

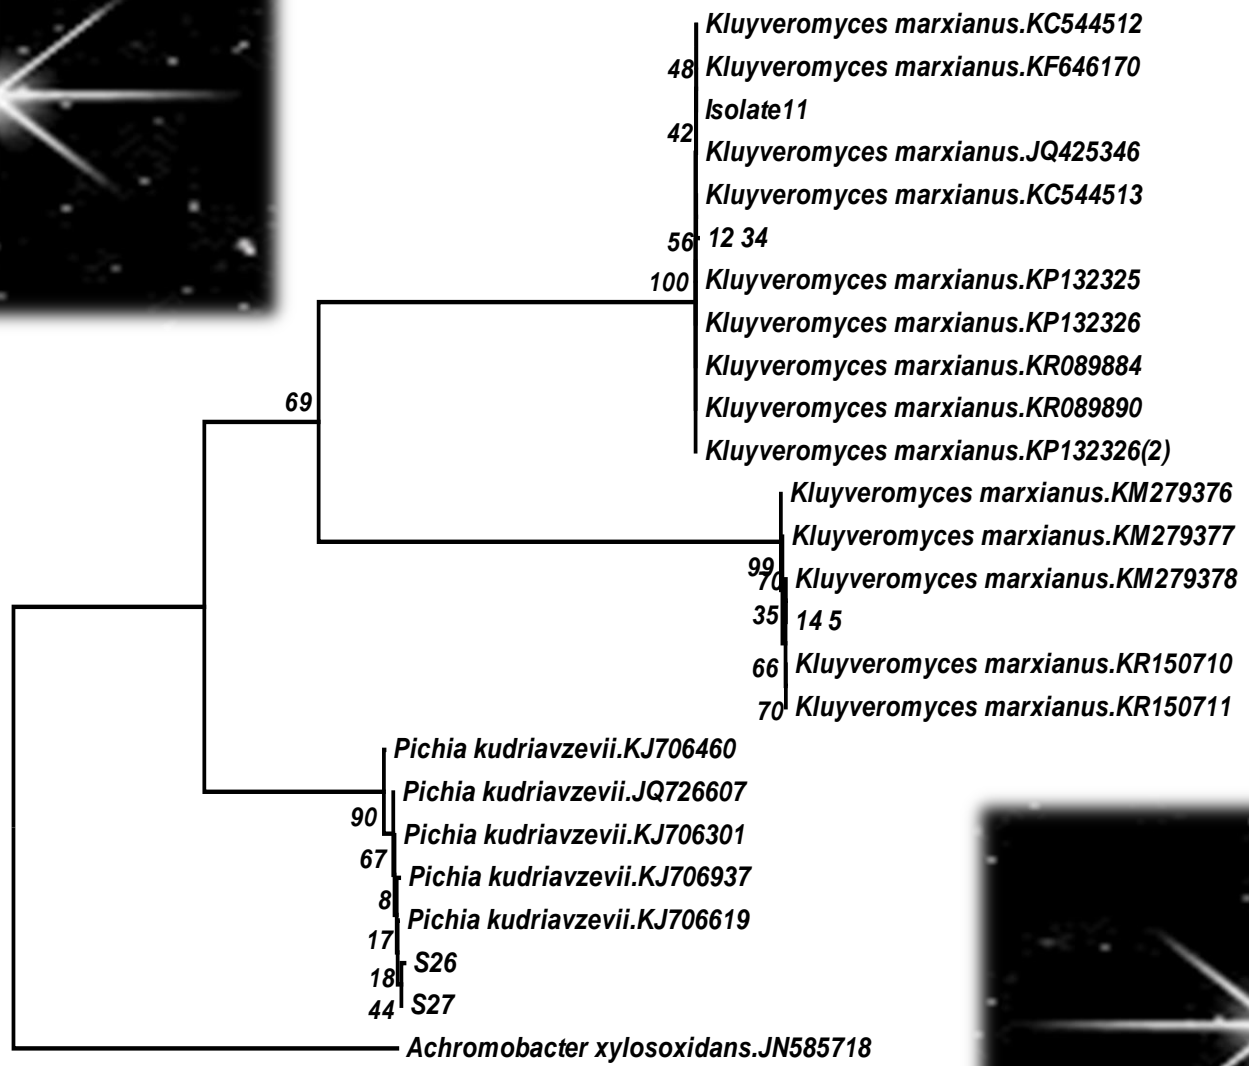

**Ethanol production by the 10 best isolates from Nigeria at 42°C and 45°C.**

0.2

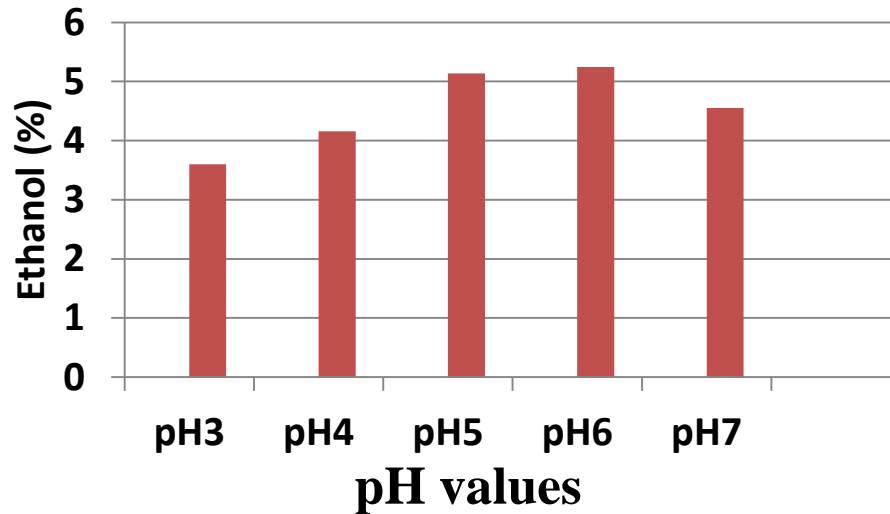

# Phylogenetic tree for the isolates

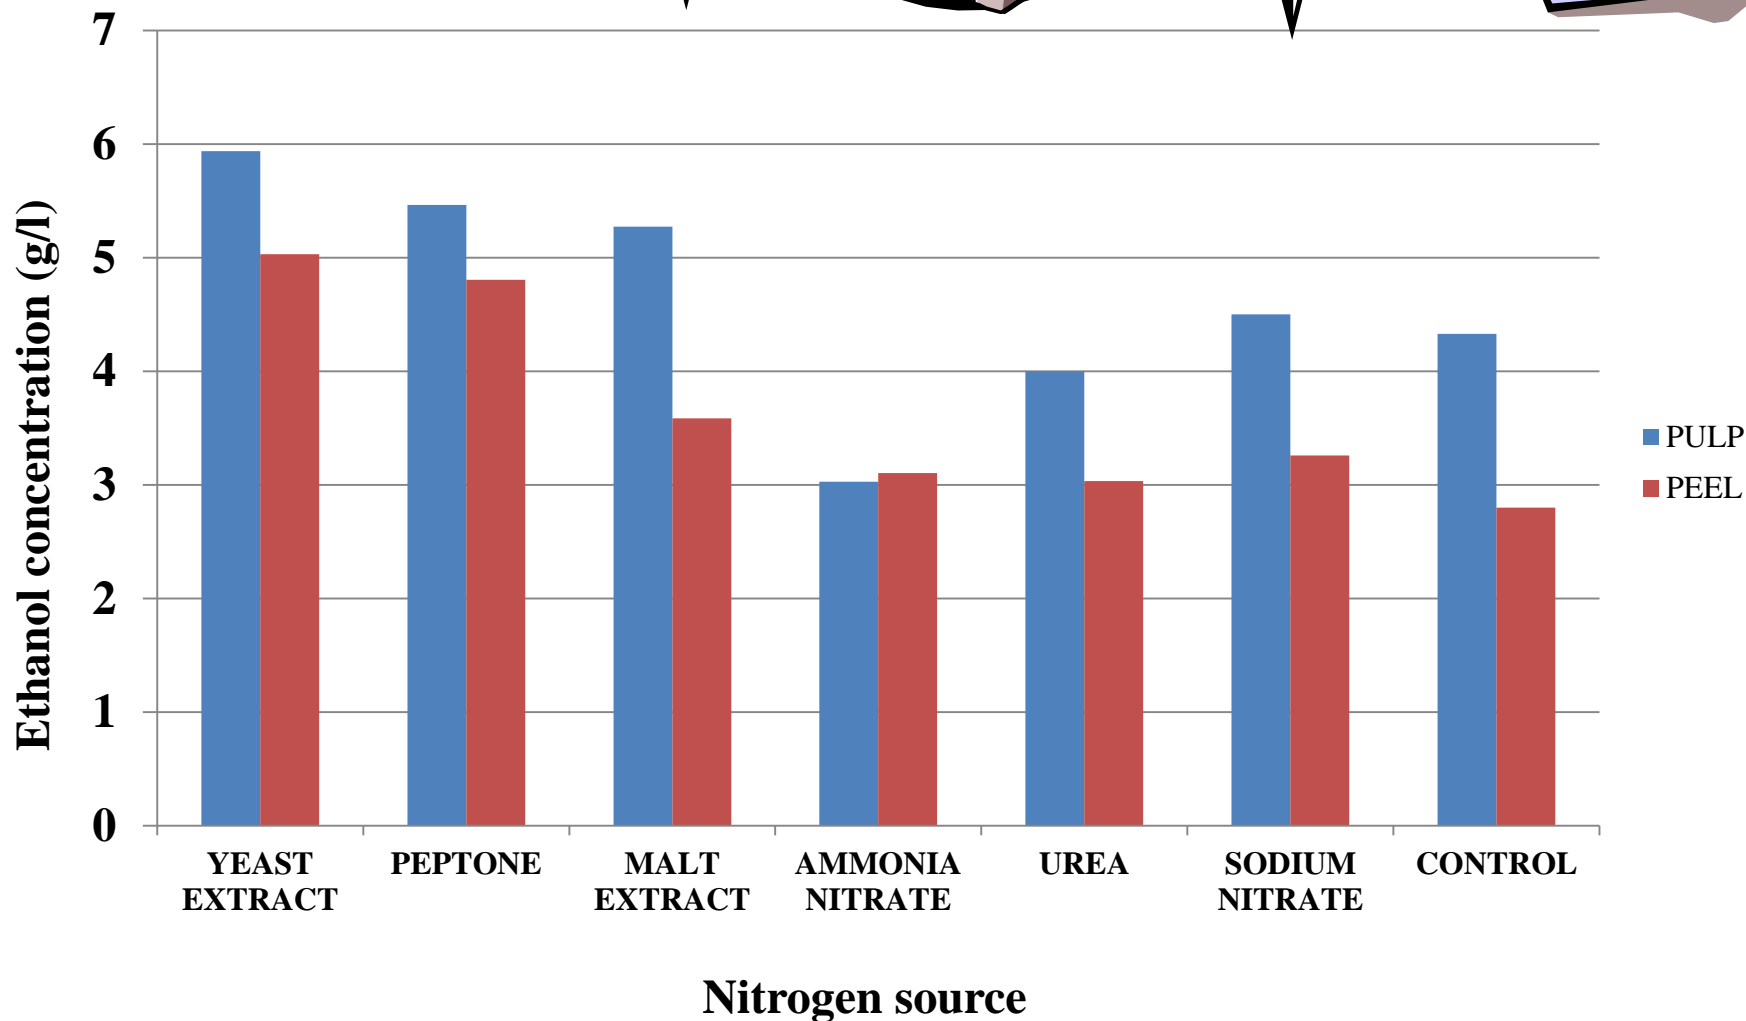

**Effect of temperature on simultaneous saccharification and ethanol production from cassava pulp and peel.**

**Effects of pH on the maximum ethanol concentration produced from 20% cassava pulp.**

**Effect of nitrogen source on ethanol production from cassava pulp and peel**

**Time courses of ethanol production from 20% cassava peel and pulp in flask cules**

## Fermentation of Cassava pulp using a 5 L jar fermentor

**Yeast seed culture Companies**

**Yeast paste or broth**  
→

**Small scale cassava processors**

↓ **Cassava peels/pulp**

**Small scale ethanol production Companies**

← **Crude amylase**

**Crude enzyme companies**

↓ **40~60% Ethanol**

**Large scale Re-distillation, Rectification and Dehydration Company**

↓ **99.5% Ethanol**

**Petroleum Refinery Industry**

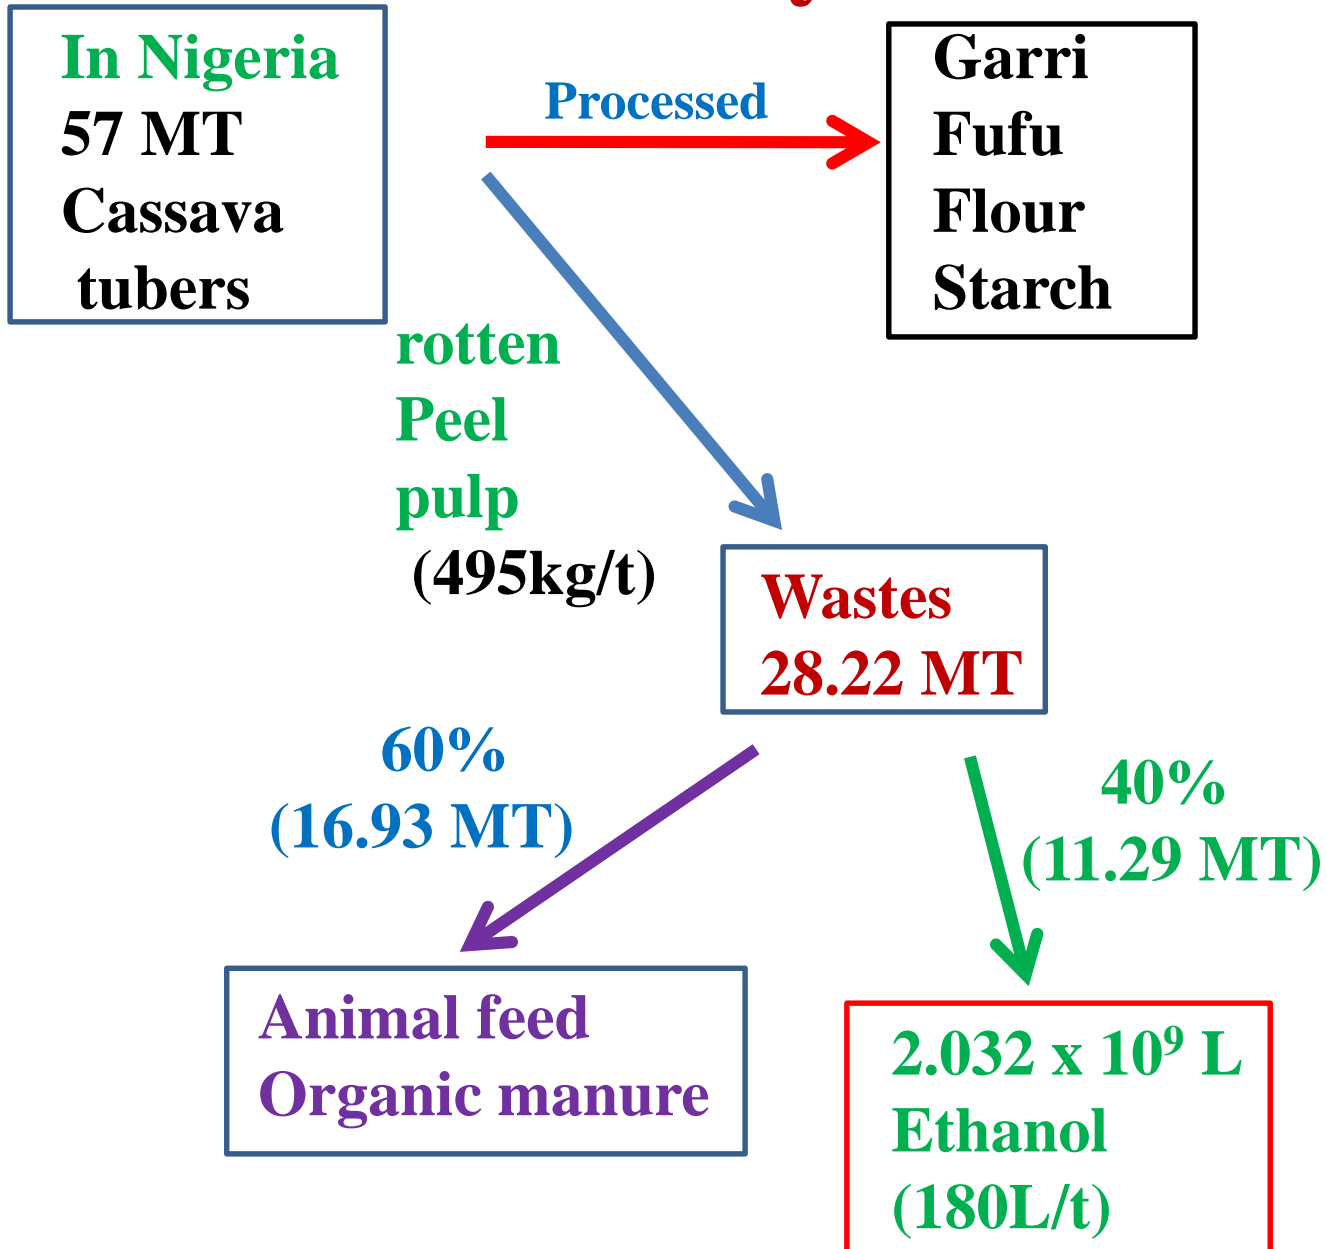

↓ **Gasohol**

**Gasoline Retailers**

**Industrial cluster model for commercial fuel ethanol production**

# Summary

## Conclusion

According to National Bureau of Statistics, Nigeria consumed 54.3 million liters of PMS daily within the first quarter of 2017. This requires 5,430,000 L of ethanol per day to make E10 gasohol (90% gasoline with 10% ethanol), amounting to 1,981,950,000 liters of ethanol per year. This can be supplied by converting wastes from 40% of the annual 57 million tones of cassava to ethanol.

Currently, Nigerian local refineries are producing only about 8 million liters of PMS per day. This requires only 800,000 liters of ethanol per day (292,000,000 L per annum) and can be supplied by converting wastes from only 5.84% of cassava produced in Nigeria.

# THANKS

I hereby express my gratitude to IRENA for inviting me to participate in this meeting and thank all of you for listening.
